

WP Secure Links

WP Secure Links helps you place secure links to downloadable files on WordPress Pages and Posts.

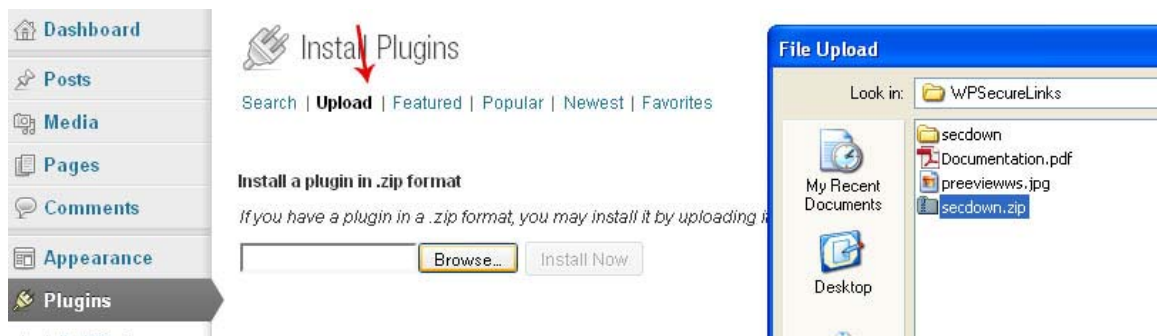

Installation

1. Login to WordPress Dashboard and go to **Plugins=>Add New**.

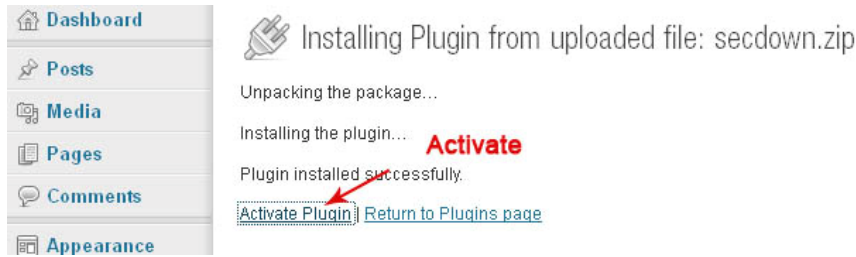

Screen Shot 1

2. Locate Secdown folder inside the purchased and Zip or achieve it with **WinZip, 7-Zip** or any other file achieving application.
3. Upload **secdown.zip** zipped folder that you just created from the **UPLOAD** menu at the top sub navigation on the page.

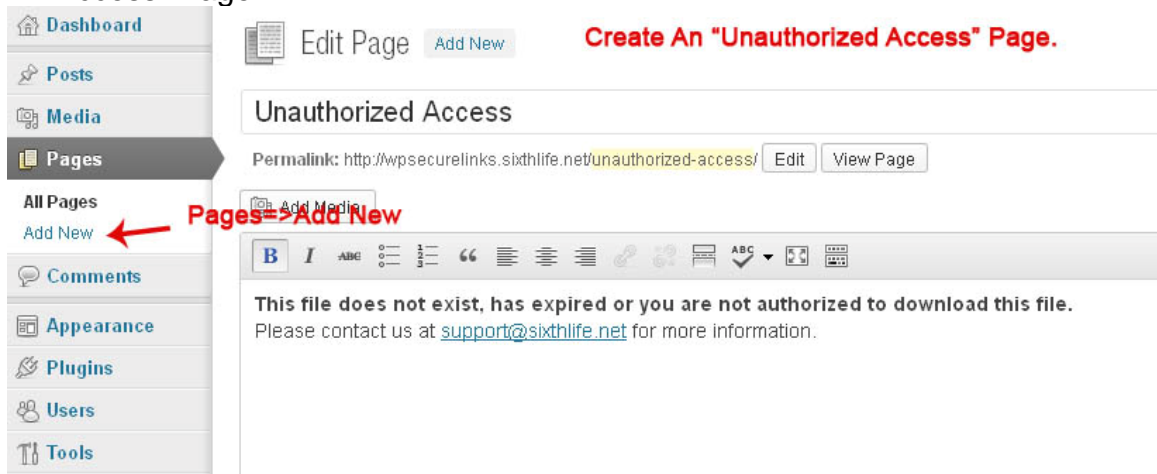

Screen Shot 2

4. Click on Install Button to **install** the Plugin and **Activate**.

Screen Shot 3

5. Go to **Pages=>Add New** in the left menu and create a Page the user will be redirected to after invalid download attempts. Namely an “Unauthorized Access” Page.

Screen Shot 4

6. Go to **Settings=>WP Secure Links** and select the Unauthorized Access page you just created and **save** the settings.

Screen Shot 5

Optional Settings

Two other settings provided are Number of Files and StartOver. These have default values.

Number of Files – is the maximum number of files that you may possibly have. Currently it is 10000.

StartOver – Is the number of days after which old access data should be deleted from the database to clean up. Currently it is set to 30 days.

For a high traffic website you may want to reduce it to 5, 10 or 15 days.

Creating a Secure Link

1. In WordPress Dashboard go to **Pages=>Add New**
2. Create a new Page/ Edit Existing Page on which you want to add links to downloadable files.
3. Use the newly added “**slink**” short tag in the WordPress Editor, text view menu to add the short tag.

Screen Shot 6

4. Add Actual URL to the file for which a secure link is to be created in the url parameter between the quotes.

[slink url=""]My Download File[/slink]

Screen Shot 6

5. Add the Anchor Text i.e name/small description of file.
6. Add the slink closing tag by clicking on slink short tag in the WordPress Editor.

Example:

[slink url="http://wpsecurelinks.sixthlife.net/sec_files/sampledoc.doc"] My Download File [/slink]

where http://wpsecurelinks.sixthlife.net/sec_files/sampledoc.doc is the actual link to the downloadable file.

My Download File is the anchor text or name of the file that will be displayed on the page.

Additional Properties for slink short tag:

In addition to the url property for slink short tag other properties that you can use are name, class, id, title.

Example:

[slink url="http://wpsecurelinks.sixthlife.net/sec_files/sampledoc.doc" name="My Secret Download File" id="afile" class="linktext" title="A Sample Download"] My Download File [/slink]

name = > The fake filename that you want to show to the user at the time of downloads.

class=> The css class you want to add for styling purpose.

Id=> The css id that you want to add to the link.

Title=>The text to go in the title property of link being created.
